Viktor Liutianskyi

born.to.run.unix@gmail.com · dotfive · PeopleDispose

Summary

- Software engineer with extensive experience building web and distributed systems, including microservices-based architectures. Experienced in building scalable distributed systems and optimizing high-load, data-intensive applications
- Core competencies:
  - Strong background in object-oriented design, SOLID principles, and domain-driven design
  - Proven experience scaling systems and optimizing database and data access layers
  - Expertise in distributed systems, asynchronous messaging (Kafka, RabbitMQ), and performance tuning
  - Hands-on experience with relational and NoSQL databases (PostgreSQL, SQL Server, Redis, MongoDB, Elasticsearch, Neo4j)
  - Experienced in building and deploying applications using modern DevOps and containerization tools

Education

Master Degree in Electronic Systems

2006 - 2011

Donbass State Technical University

Department of Industrial Electronics.

Experience

Junior .NET developer 2014 - 2016
Malkos/Core Value

.NET engineer 2016 - 2017
HYS Enterprise

Senior .NET developer 2017 - 2017
Intego Group

Integrated a cloud-based work management platform with a third-party system. Optimized database and data access layers for efficient multi-tenant queries.
Key technologies: .NET Core, Razor, Entity Framework Core, MS SQL Server, ReactJS, Node.js, Azure, Zapier

Software engineer → Senior software engineer 2017 - 2019
Lohika

Joined a service-oriented, IoT-like product in the passenger transportation domain. Improved core services and database performance to support 10× higher request load and handle updates from a larger number of tracked entities. Reduced application startup and initialization time. Implemented parallel event processing with conflict resolution.
Designed the server-side architecture for a therapy advisory prototype.
Key technologies: SOA, high availability, ASP.NET WebAPI, Dapper, SQL Server, ReactJs, Docker

Senior software engineer from 2019
Svitla Systems

Maintained and developed from scratch services in a few domains for distributed multi-tenant cloud-based high available system in area of hospitality and retail.
Contributed to multiple initiatives and improvements, including:
- implementation of housekeeping and room maintenance tracking with availability planning;
- enhancement of an event storage service with reference resolution and user-friendly data presentation;
- consolidation and synchronization of aggregates across domains;
- reduced network and database load during core service event processing;
- designed and implemented infrastructure for safe asynchronous processing of aggregates, ensuring consistency and no data loss.

Participated in extending platform services, including core like reservations booking, profile management, and system configuration.
Contributed to adoption AI tools for speeding up application development and optimize code review process.
Key technologies: Microservices, event-driven architecture, eventual consistency; .NET Core: C#, WebAssembly via Blazor, Entity Framework Core; PostgreSQL, Redis, Elastic; Kafka; Docker, Kubernetes, AWS, Jenkins, Gitlab; ELK, Grafana; Kiro, Q Developer
